Whitewater Rafting Prototype

Review: I was extremely lucky to receive this prototype. The storyboards are very clear and the communication is very straightforward. I immediately felt sorry for the person who got mine!

I liked the storyboard frame set-up as the information was always in the same spot and is very easy to follow. The storyboards came with a folder containing the images to be used. The photos are clear. The font and size are explicit. The colors for buttons are suggested as "find something that matches the background", which makes sense. I used shapes as buttons as that allows more options. There are more than ten slides, but that was okay since the materials were provided. I added the user's name to some slides. User name is mentioned in the flowchart, but not the storyboard. I inserted where I would want the user name to be included. I may have changed up some text, but not much. Since this material needs to viewed on a cell phone for reference, your simplicity with instructions are fantastic.

I really stuck to the storyboards and questioned whether I should add my own ideas. I think this is where it is important to know your client. There are some clients that trust and expect creativity, while others want a developer to stick to the client's vision.

Suggestions: Your directions, flowchart, and summary were very well-written. Thank you! You will have to add a way to keep track of "passing" the modules. I would add some audio. Also, you could branch to different "review" material like a drag and drop or matching (with no advancement until correct) for further practice instead of returning to the already presented material. Also, I would have a transparent splash page to show off your photo of the river instead of the white rectangle in the center. Or, move the text to the edges. Also, I would have the photos launch full page with the instructions in a less framed box to make it more visually interesting. I would get rid of the edge between text and photos. Does that make sense?

Future: Overall, I think your storyboards should be used as a model for how to do storyboards. I would have loved to have reviewed these before creating my own. Good job!
